Here's some helpful information about Medicare Measures and how to bill them. These measures are triple weighted in determining your Provider Quality Score.

The two most common and critical health indicators are Blood Pressure & Blood Sugar (HbA1c) and should be measured at every encounter until the goal is satisfied.

Blood Pressure – Systolic, Goal < 140/90 mmHg	
Measured Systolic	CPT Systolic
< 130 mmHg	3074F
130 – 139 mmHg	3075F
>= 140 mmHg	3077F

Blood Pressure – Diastolic, Goal < 140/90 mmHg	
Measured Diastolic	CPT Diastolic
< 80 mmHg	3078F
80 – 89 mmHg	3079F
>= 90 mmHg	3080F

Tips for Measuring BP:

Measure near the end of the visit, advise patient not to talk during measurement. Ensure patients are not crossing their legs during measurement as it can artificially increase systolic pressure.

Blood Sugar – Goal <=9.0%	
Measured HbA1c	CPT Code
<7%	3044F
>=7% and <8%	3051F
>=8% and <=9%	3052F
>9%	3046F

Tips for Measuring Blood Sugar:

This measure depends on the final reading taken during the calendar year.
